

# FTP/SFTP

## Setting up access to FTP Server

---

Follow steps:

1. Go to the "Settings" tab.
  2. Make sure the "Storage API" is set to "Http".
  3. Select the desired FTP / SFTP connection protocol. Ask your server administrator which of these protocols you are using, if you do not know. Fill all fields related to the selected protocol.
  4. Fill in all the required fields for FTP / SFTP.
  5. Download base link (DBL) - base link, it is necessary for the client to work, your files will be downloaded by the client according to the following rule: DBL + "Definition folder" (DF) + file name. For example, DBL = "https://example.com/patches/" and DF = "win". Patcher Client will download the files for the current definition at the following link: "https://example.com/patches/win/". Keep in mind that this path should be accessible to all Internet users via a direct link.
  6. After all the fields have been filled out, click the "Test" button. If you received the message "Congratulations!" then the system is ready to go. If you get an error message check the console window there will be detailed information about the error.

## FTP

---

FTP Protocol:	FTP
FTP Domain:	example.com
FTP Port:	21
FTP User:	
FTP Password:	
FTP Home Directory:	
Download base link:	https://example.com/patches/
Test	

- FTP Protocol - data transfer protocol, select FTP.
- FTP Domain - enter the domain name of your ftp server.

Do not use "/" in the end of this field.

- FTP Port - connection port, for FTP by default 21.

- FTP User and FTP Password - your credentials.
- FTP Home Directory - enter the path to the folder for which the rights to write files and create folders are assigned.

If the root folder is for this user, leave the field blank.

## SFTP

FTP Protocol:	SFTP
FTP Domain:	example.com
FTP Port:	22
FTP User:	
FTP Password:	
FTP Home Directory:	
Open SSH key:	Please select key file <span>Change</span>
Key file passphrase:	
Download base link:	https://example.com/patches/

Test

- FTP Protocol - data transfer protocol, select FTP.
- FTP Domain - enter the domain name of your ftp server.

Do not use "/" in the end of this field.

- FTP Port - connection port, for FTP by default 21.
- FTP User and FTP Password - your credentials.
- FTP Home Directory - enter the path to the folder for which the rights to write files and create folders are assigned.

If the root folder is for this user, leave the field blank.

- Open SSH key - open ssh key for ssh connection.
- Key file passphrase - passphrase of open ssh key.

## Example

I want to upload sgpachter files to "patches" folder on the server. In my ftp manager I see "www/example.com/patches". Website "https://example.com/" follows to "www/example.com" folder. What should I write in the fields?

You should set "Home Directory" to "www/example.com/patches/". And set "Download base link" to "https://example.com/patches/".
